

Multi Fuel Grate

IMPORTANT INSTRUCTIONS FOR USE

To burn correctly wood needs air from above and coke/coal from below. You MUST remove the grate if you are burning wood. If you leave it in creosote is formed which will block or damage your flue as the wood is not burnt correctly or efficiently. Do not mix wood and multi-fuel!

YOU MUST TAKE OUT ANY GRATE COMPLETELY FOR BEST EFFICIENT PERFORMANCE WHEN BURNING WOOD.

The multi-fuel grate is a retrofit component. Like all multi-fuel, it will be lower than a wood burning stove, but as we are starting from a higher starting efficiency it will still be higher than most (if not all) other multi-fuel stoves. The benefit with ours is, if you buy a multi-fuel you always have an inefficient stove, even when you burn wood, with ours, if you want to burn wood you take the grate out and you are back up to 89% efficiency.
